

Moisture entering your oil? **Oilan provides you with** **the exact data**

*Kytölä Mess- und Regeltechnik GmbH's
Oilan is an online condition monitoring
device for early detection of moisture
entering a lubrication system.*

Kytölä's Oilan detects and signals the ingress of moisture in your lubrication system.

The controlling process is carried out uninterrupted within a real-time online procedure. This ensures that any change in the specific humidity of lubricants is detected immediately and recorded.

In many cases it is possible to determine the cause for the increase of moisture in the lubrication system. Therefore Oilan is ideally suited to be used in preventive maintenance schemes.

A typical application, for instance, is use in an early warning system for detecting leakages in heat exchanging devices.
